

### Short description

这种磁场探头用于测量受试设备中的脉冲磁场。借此可以查明干扰电流的路径。使用时，把这种磁场探头接到SGZ 21脉冲群发生器。

The magnetic field generated by SGZ 21 within the assembly, penetrates the probe head and induces a voltage. This drives the optical transmitting diode of MS 02. Its optical signals are transmitted via LWL to the measuring input (pulse density counter) of SGZ 21.

# MS 02

磁场探头

Probe head
